

CONFIDENTIAL · AUGUST 2026

NetSuite Account Analysis

ACME · Corporate events / DMC / experiential · account
3966253 — what is configured, what is actually used, and what
it implies for planning. Read out of the system over SuiteQL.

345,030

transactions on record

445

GL accounts

2,212

billed customers

21 of 37

modules actually in use

1. Executive summary

What this document is. A structured analysis of the NetSuite account, built entirely from data read out of the system itself. It is meant to be used in whatever conversation it is useful for — an account business review, a discovery session, scoping a Planning or analytics implementation, or simply as a shared picture of how the system is being used today. Nothing here is a proposal; the recommendations in section 5 are starting points to validate together.

\$200.0M

Revenue 2025

38%

Gross margin

\$21.2M

Operating result*

15,353

Projects / events

35%

Top-10 concentration

* Net result before goodwill amortization and interest — see §3.

Micro-vertical: Corporate events / DMC / experiential

Detection confidence: high.

Pass-through model: the client is billed and dozens of vendors are paid per event. Margin lives in the management fee, so profitability PER EVENT is the metric that matters.

What the data shows: 15,353 projects on the books, 9 vendor bills for every customer invoice, no inventory, effectively no capital expenditure. That ratio is the signature of a pass-through operation — the company assembles and coordinates an event by buying from many suppliers and billing the client once. The cost-of-sales accounts are effectively the service catalogue: Décor/Scenic, Transportation, Food & Beverage / Catering, Venue, Tours & Activities - General/Legacy, Labor. Roughly 29% of billings come from accounts that are themselves event or incentive agencies, so a meaningful share of the work arrives through a channel rather than direct from the end client.

Identified from the account's own vocabulary — audio visual in item names, decor in item names, scenic in item names, set/strike in item names, entertainment in item names. Worth confirming with the client before it is used in any recommendation.

What this review found

- **Events are run as billing containers.** 15,353 projects carry revenue, but no cost is attributed to them — so per-event profitability, the defining metric of this model, cannot currently be measured.
- **Two parallel budget processes.** The Planning connector is installed, and budgets are still loaded natively alongside it.
- **Operating performance is obscured.** \$20.4M of goodwill amortization and interest sit inside the reported result, which understates what the operations produced.
- **Revenue swings 5.3x across the year,** which makes an evenly-phased annual plan wrong in every month.
- **35% of billings sit in ten accounts,** several of which are agencies rather than end clients — two business models inside one revenue line.
- **The systems landscape is broad and mature:** 21 of 37 modules in active use, 12 SuiteApps installed and 14 connected applications.

2. The business as the system describes it

Year	Revenue	COGS	Opex	Gross margin	Net result
2021	\$56.0M	\$35.2M	\$38.6M	37%	-\$17.8M
2022	\$170.2M	\$107.8M	\$58.8M	37%	\$3.6M
2023	\$152.8M	\$94.7M	\$67.2M	38%	-\$9.2M
2024	\$174.7M	\$108.5M	\$72.7M	38%	-\$6.5M
2025	\$200.0M	\$123.8M	\$75.4M	38%	\$0.7M
2026 *	\$125.1M	\$81.3M	\$44.4M	35%	-\$0.6M

* Partial year. GL figures with `posting='T'`; not audited financial statements.

The reported result understates operating performance. In 2025 the net result of \$0.7M absorbs \$14.1M of goodwill amortization and \$6.4M of interest expense. Excluding those, operating performance is close to **\$21.2M**. The goodwill charge points to acquisition history and the interest charge to leverage; neither reflects how the operations performed.

Seasonality

Monthly revenue, \$M, last twelve full months. Peak-to-trough: **5.3x**.

Customer concentration

#	Customer	Billed	Cumulative
1	Customer 1	\$81.9M	8.8%
2	Customer 2	\$56.5M	14.8%
3	Customer 3	\$42.0M	19.3%
4	Customer 4	\$30.3M	22.6%
5	Customer 5	\$25.8M	25.3%
6	Customer 6	\$21.5M	27.6%
7	Customer 7	\$20.2M	29.8%
8	Customer 8	\$18.3M	31.8%
9	Customer 9	\$18.0M	33.7%

10	Customer 10	\$15.4M	35.4%
----	-------------	---------	-------

2,212 billed customers. Top 10 = **35.4%**, top 25 = **49.6%**.

Cost composition (2025)

Account	Type	Amount
Salaries	Expense	\$30.0M
Cost of sales - Décor/Scenic	COGS	\$27.1M
Cost of Sales - Transportation	COGS	\$18.7M
Cost of Sales - Food & Beverage / Catering	COGS	\$15.1M
Cost of Sales - Venue	COGS	\$13.8M
Amortization of Goodwill	Expense	\$12.7M
Cost of sales - Tours & Activities - General/Legacy	COGS	\$10.1M
Cost of Sales - Labor	COGS	\$8.9M
Cost of Sales - Entertainment	COGS	\$7.5M
Cost of sales - Production Support	COGS	\$6.6M
Interest Expense (Income)	Expense	\$5.8M
Cost of Sales - 3rd Party Incentives/Commissions	COGS	\$4.4M

Capital expenditure in 2025: **-\$0.1M** · payroll expense \$30.2M — an asset-light operating model.

3. Systems landscape

			In use 21	Partial use 3	Not used 4	Not enabled 4	Not visible 5
Module	Status	Evidence					
OneWorld / Subsidiaries	In use	3 subsidiaries					
Multiple Currencies	In use	4 currencies · 8,770 exchange rates

Automation and SuiteCloud Processor load

Script type	Deployment status	Count
SCHEDULED	NOTSCHEDULED	365
SCRIPTLET	RELEASED	361
MAPREDUCE	NOTSCHEDULED	286
USEREVENT	RELEASED	189
CLIENT	RELEASED	81
RESTLET	RELEASED	45
SCHEDULED	SCHEDULED	25
PORTLET	RELEASED	20
BUNDLEINSTALLATION	RELEASED	12
MAPREDUCE	SCHEDULED	8

1,430 script deployments in total · 26 workflows (3 inactive) · 20 registered integration applications.

651 of 1,430 script deployments never run. They sit at `NOTSCHEDULED` — deployed but not scheduled. Only 33 scheduled and map/reduce scripts actually consume SuiteCloud Processor capacity. That is worth reading two ways: the processor is far less loaded than the script count suggests, and there is a large body of automation that was built and then left dormant.

Systems already covering adjacent ground. Worth mapping before any new scope so nothing is duplicated. An active token tells us a connection exists, not how heavily it is used.

- **Concur connector** (Travel and expense, since 11/28/2018) — Expense reports may not live in NetSuite, with the same effect.
- **Celigo Salesforce Connector** (CRM, since 12/19/2018) — The sales pipeline lives outside NetSuite, which matters for revenue planning.
- **Ramp Integration** (Expense / corporate cards, since 9/24/2021) — A spend source outside the GL, which limits the detail available for planning.
- **FloQast** (Close management / account reconciliation, since 11/4/2021) — Already covers account reconciliation and close management. Worth understanding its current scope before anything adjacent is considered.

4. Data foundation for Oracle EPM Planning (NSPB)

This section is written for whoever scopes or builds the Planning implementation. It answers the questions that decide the model before any design work starts: how large the Account dimension will be, which segment dimensions the data can actually support, where actuals have to be read from, and which saved searches the NetSuite → NSPB integration would need. The same reading applies to Account Reconciliation and Analytics Warehouse, which draw on the same foundation.

410 Leaf accounts to map	35 Rollups rebuilt in Planning	3 Hierarchy levels	127 Leaves with no activity
------------------------------------	--	------------------------------	---------------------------------------

Environment shape — what the Planning team needs to know

Aspect	What we found	What it means for the model
Legal entity structure	3 subsidiaries, 1 of them elimination	Entity becomes a real dimension with a consolidation rollup. An elimination entity already exists, so intercompany treatment has a home.
Geographic spread	US	Single jurisdiction, which keeps consolidation simple.
Functional currency	single functional currency (US Dollar)	No translation between entities. A currency dimension is likely unnecessary for consolidation.
Transactional FX	4 currencies, 8,770 exchange rates, 1,140 consolidated rates	Despite the single functional currency, transactions are recorded in several currencies. Confirm whether the plan needs to be built in local currency or only in the reporting one — it is the difference between a simple model and a rate-driven one.
Accounting books	1	Single book, so there is no ambiguity about where actuals come from.
Fiscal calendar	323 accounting periods	Confirm the fiscal year start and whether periods are calendar months before mapping Period.
Statistical accounts	2	These carry drivers such as headcount or volume. Few or none means drivers have to be built or sourced elsewhere.

Planning dimension	NetSuite source	Members	Tagged	Usable for planning?
Entity	Subsidiary	3	100%	Reliable
Account	Chart of accounts (leaf level)	410	—	—
Period	Accounting periods	323	—	—
Currency	Currencies	4	—	—
Cost centre	Department	18	8%	⚠ Effectively untagged
Custom	Class	7	27%	⚠ Effectively untagged
Custom	Location	55	82%	Usable — confirm the gap
Custom	Custom segment	1	—	—
Project	Jobs	15,353	—	—

Member counts are what exists in the account. **"Tagged" is the share of transaction lines that actually carry a value** for that dimension over the last twelve months (360,253 lines) — a plan can only ever be as granular as the tagged actuals underneath it.

2 dimensions are not tagged consistently enough to plan against. **Department** carries a value on only 8% of transaction lines; **Class** carries a value on only 27% of transaction lines. Planning at that level would produce a model that cannot be reconciled to the general ledger, because most of the actuals have nowhere to land. Either the tagging is corrected upstream, or the model is designed at a level the data can support — that is a decision worth taking before any build starts, not during it.

Saved searches the Planning integration would need

Saved search	Record type	Columns	Why
GL Actuals	Transaction (accounting lines)	Account, Period, Amount, Subsidiary, Location	The backbone of the actuals load. Segment columns limited to the dimensions the data actually carries.
Revenue by Customer	Invoice / Revenue Arrangement	Customer, Item, Amount, Date	Has to come from the billing layer: revenue is recognized through journals that carry no entity, so the GL cannot answer "revenue by customer".
Cost of Sales by Service Line	Transaction (accounting lines)	Account, Period, Amount, Vendor	Cost of sales is already split by service line in the chart of accounts — this is what makes a margin plan possible without redesigning anything.
Project / Event Actuals	Transaction (accounting lines)	Project, Account, Period, Amount	⚠ Only viable once cost is attributed to projects — today 15,353 projects carry revenue but no cost.

Deliberately left out of the actuals search: Class (27% tagged), Department (8% tagged). Including a segment the data does not carry produces a load that appears to work and then fails to reconcile.

One structural constraint worth knowing early. Revenue is recognized through journal entries that carry no entity, so at general-ledger level revenue has no customer attached. Customer-level actuals have to come from the billing layer, not the GL. Assumptions to the contrary tend to surface late in an implementation, once the model is already built.

Configuration debt

Finding	Figure	What it means
Custom fields never populated	74 / 153	Candidates to retire, once dependency on scripts and integrations is confirmed.
Accounts with no journal activity	93 / 445	Would inflate the Account dimension if carried into a planning model.
Custom records / lists	205 / 155	Ongoing maintenance surface.
Scripts / deployments	800 / 1,430	Live customization to regression-test on every upgrade.

5. What BPC recommends

Each recommendation below is grounded in a figure measured in the account. They are **suggestions to validate together** — the data tells us what is happening, not why, and the why usually changes the priority.

A. Within NetSuite — for a corporate events / dmc / experiential business

These follow from how a corporate events / dmc / experiential operation runs, not from a generic checklist. They stand on their own and also unblock everything downstream.

What businesses like yours typically run, that is not in place here

Based on the micro-vertical identified in section 1 — **Corporate events / DMC / experiential** — compared against what mature organizations in that niche usually have configured.

Capability	Current status	What we found
Project Management / SuiteProjects	Partial use	15,353 projects · projecttask 0 · timebill 0 · timesheet 16,824
Expense Reports / Time Tracking	Not visible	no Expense Report transactions
Approval Routing (SuiteApprovals)	Not visible	not observable through SuiteQL

There are also purpose-built SuiteApps for this industry that are not installed: **ConventionSuite** (event and service management built on NetSuite), **Sererra EventSeries** (event management for NetSuite), **NuSmart Event Management** (events, budgeting and attendee management). No SuiteSuccess edition exists for events/DMC. The closest is Services (PSA). That is a finding in itself: the niche is poorly served by the standard and gets solved with third-party SuiteApps.

This is a comparison against what mature organizations in the same niche typically run — not a recommendation to buy any of it. Whether each one is worth having depends on how you operate, which is a conversation rather than a data point.

High

NS1. Make the profit on each event visible

WHAT WE FOUND IN YOUR ACCOUNT

15,353 projects carry billing, but project tasks and time-to-charge are both at zero. Cost of sales is already broken out by service line (Décor/Scenic, Transportation, Food & Beverage / Catering, Venue), so the cost taxonomy exists — it simply is not attributed to the event that consumed it.

WHAT WE RECOMMEND

We recommend attributing cost of sales to the event that incurred it, and enabling the minimum PSA footprint needed to carry that. It does not require redesigning your chart of accounts — the service-line split is already there.

WHY IT MATTERS FOR YOUR BUSINESS

In a pass-through model gross revenue is a poor guide: the margin lives in the management fee and in how tightly each event is run. Without cost by event there is no way to tell a profitable program from one that consumed its fee. At \$200.0M of revenue and 38% gross margin, a one-point improvement in event-level execution is worth roughly \$2.0M a year.

HOW WE WOULD HELP

Design the job-costing model against the existing COGS taxonomy, configure the project structure and cost attribution, and stand up an event-level P&L that ties back to the GL.

Medium **NS2. Clean up the chart of accounts before it is mapped into Planning**

WHAT WE FOUND IN YOUR ACCOUNT

93 accounts have no journal activity at all, and 127 of the 410 leaf accounts show no movement in the period analysed.

WHAT WE RECOMMEND

Review inactive and unused accounts and retire what is genuinely dead before the structure is carried into a planning model.

WHY IT MATTERS FOR YOUR BUSINESS

Every account carried across becomes a dimension member that has to be maintained, calculated and reported on forever.

Cleaning is far cheaper before the mapping than after, when references exist in forms, rules and reports.

HOW WE WOULD HELP

Produce the candidate list with usage evidence for each account, and run the review with finance so the decision is documented.

Low **NS3. Retire the configuration nobody uses**

WHAT WE FOUND IN YOUR ACCOUNT

74 of 153 measurable custom fields have never held a value, alongside 205 custom record types and 800 scripts.

WHAT WE RECOMMEND

Review the never-populated fields for retirement, confirming first that none is written by a script or a low-frequency integration.

WHY IT MATTERS FOR YOUR BUSINESS

Unused configuration is not free: it lengthens every upgrade regression, clutters the interface for users, and makes it harder to tell which fields matter when the next integration is designed.

HOW WE WOULD HELP

Provide the evidence-backed list and the dependency check, so removal is a decision rather than a risk.

B. For an Oracle EPM implementation (NSPB)

What a Planning implementation would have to account for, whether it is a new build or a rescue of the one already licensed.

High **EPM1. Plan your two revenue engines separately**

WHAT WE FOUND IN YOUR ACCOUNT

2,212 billed customers, but the top 10 represent 35.4% and the top 25 49.6% of billings. Several of the largest accounts are themselves event and incentive agencies, together about \$267.4M — meaning a substantial share of volume arrives through a channel rather than direct from the end client.

WHAT WE RECOMMEND

Model channel business and direct corporate business as distinct revenue engines, with their own drivers, margin assumptions and pipeline logic.

WHY IT MATTERS FOR YOUR BUSINESS

The two behave differently: channel volume is fewer, larger, more contractual relationships with thinner margin and concentration risk; direct business is higher-touch with different seasonality and win rates. A single blended forecast will be wrong on both, and it hides the concentration exposure.

HOW WE WOULD HELP

Segment the revenue base, build the driver set for each engine, and design the planning model so that a shift in mix is visible rather than absorbed.

Medium **EPM2. Build your seasonality into the plan instead of averaging it out**

WHAT WE FOUND IN YOUR ACCOUNT

Monthly revenue swings 5.3x between the strongest and weakest month of the last twelve.

WHAT WE RECOMMEND

Plan at monthly granularity with explicit seasonal profiles by service line, and extend the same curve to the cash and working-capital view.

WHY IT MATTERS FOR YOUR BUSINESS

An annual target divided by twelve is wrong every single month in a business shaped like this, which makes variance reporting meaningless — every month shows a variance that is really just the calendar. Vendor prepayments and receivables follow the same curve, so the cash requirement peaks well before the revenue does.

HOW WE WOULD HELP

Derive seasonal profiles from actual history rather than assumption, and build the phasing logic into the model so it survives a change in event mix.

Medium **EPM3. Show operating performance separately from financing charges**

WHAT WE FOUND IN YOUR ACCOUNT

The 2025 net result of \$0.7M absorbs \$14.1M of goodwill amortization and \$6.4M of interest expense — about \$20.4M of non-operating charges. Adding them back places operating performance near \$21.2M.

WHAT WE RECOMMEND

Structure the plan so that operating performance is visible on its own, with financing and purchase-accounting effects presented below it.

WHY IT MATTERS FOR YOUR BUSINESS

As reported, the business looks close to break-even, which is not what the operations are doing. Any target, incentive or investment case built on the net line will be aimed at the wrong number, and operational improvements will be invisible next to the amortization charge.

HOW WE WOULD HELP

Define the reporting structure with finance, and build the model so both views come from the same data rather than from a separate spreadsheet.

High **EPM4. Read customer revenue from the right place**

WHAT WE FOUND IN YOUR ACCOUNT

Revenue is recognized through journal entries that carry no entity, so at general-ledger level there is no customer attached to revenue.

WHAT WE RECOMMEND

Source customer-level actuals from the billing layer — invoices and revenue arrangements — rather than from the GL, and validate that the two tie at total level.

WHY IT MATTERS FOR YOUR BUSINESS

Any plan or report that assumes customer revenue can be read from the GL will silently return nothing, or worse, partial figures. This is the kind of assumption that is usually discovered months into an implementation, after the model is built.

HOW WE WOULD HELP

Define and test the extraction path, and build the tie-out that proves billing-layer revenue reconciles to the GL before it is relied on.

C. To clarify before scoping anything

Open questions that change the shape of any proposal.

High

OTHER1. Confirm how Planning and NetSuite budgeting fit together**WHAT WE FOUND IN YOUR ACCOUNT**

Planning is implemented: the NSPB connector bundle is in place and the integrations date back to 2/2/2021. In parallel, 15,749 budget import rows — budgets are built outside and loaded in.

WHAT WE RECOMMEND

We recommend confirming which system is intended to own the budget going forward, and whether the native loading is a deliberate parallel process or a leftover from before Planning.

WHY IT MATTERS FOR YOUR BUSINESS

Where both paths stay live, teams tend to spend time each cycle reconciling them. It is worth knowing whether that is happening here, or whether the native loads serve a purpose Planning was never meant to cover.

HOW WE WOULD HELP

Review the current Planning model against how the business plans today and identify where the two paths overlap, so the split between them becomes deliberate rather than incidental.

What we are deliberately not proposing. FloQast has been connected since 11/4/2021 and covers close management / account reconciliation. We would want to understand its actual scope before suggesting anything adjacent to it, rather than proposing capability you already own.

6. Suggested sequence

Stage	Focus	Why in this order
1	Event-level costing and the customer-actuals data path	Both are foundations. Any planning or reporting work built before them inherits the same blind spots.
2	Planning model review and remediation	Once cost and revenue can be attributed correctly, the existing Planning investment can be pointed at the right structure rather than rebuilt.
3	Chart of accounts and configuration cleanup	Cheapest to do before the structure is carried into a model, and it reduces what stages 1 and 2 have to carry.
4	Analytics and reporting depth	Most valuable once plan and actuals are reconciled and trustworthy — before that it mostly reproduces existing reporting.

7. Method and limitations

This review was generated automatically from the live NetSuite account over SuiteQL and REST, using a read-only integration role. Every figure comes from a query against the account; none is estimated or benchmarked from elsewhere. What we could **not** see:

- **5 modules** whose status cannot be determined from SuiteQL alone — a feature that is switched off and one the integration role cannot see look identical. Resolvable with an SDF export.
- **Close effort** — how long the close takes, and how many reconciliations live in spreadsheets. Not visible in data; it has to be discussed.
- **Tagging coverage** per dimension, which determines the granularity a plan can actually support.
- **The Planning side** — without an LCM export from NSPB we cannot assess the implementation already in place.
- **Integrations not using token-based authentication** — OAuth 2.0, SOAP with user credentials and SuiteAnalytics Connect do not appear in the inventory, so the connected landscape may be broader than shown.
- **Headcount** — employee records in NetSuite are not a reliable workforce source here, which suggests payroll is administered in another system.

Industry reference. No SuiteSuccess edition exists for events/DMC. The closest is Services (PSA). That is a finding in itself: the niche is poorly served by the standard and gets solved with third-party SuiteApps. Benchmark context draws on public sources (Oracle's module catalog and published SuiteSuccess material), not a proprietary base of comparable accounts — it is meant to frame the discussion rather than settle it.
