of input via Smart View ad-hoc

NSPB Current State Assessment — Northwind

Prepared by BPC · source: LCM export + 180-day application Audit (2025-12-14 2026-06-12) + Activity Report · v2026-06-16.1121

Executive summary

-  **What is implemented:** a full EPBCS application (26.05.66) with **7 cubes** (RevPlan, WFPlan, OEP_FS BSO + WFRpt, RevRpt, FinRpt, FinRptH ASO), **172 forms**, **155 business rules**, 21 dashboards, 162 Financial Reports artifacts and 252 Data Integration artifacts.
-  **What is actually used is a small fraction of that.** In the last **180 days** the audit shows **17 of 155 rules executed**, **4 real Northwind users**, and every single data change (**54,892**) entered through **Smart View ad-hoc grids** — **none through the 172 Planning forms**.
-  **The Workforce module looks abandoned:** its rules last ran **2026-02-24**, yet its cube (WFPlan) still holds **18,983,366 blocks / 11,339 MB** of stored aggregations.
-  **Usage is concentrated and shrinking:** the two heaviest users (user1@northwind.com, user2@northwind.com) stopped using the application in 2026-02/2026-03; today essentially **one person** drives it.
-  **The opportunity:** decide module by module — *retire what is not used* (or *re-onboard users to what was paid for and built*), refresh the stale configuration (substitution variables still at "Jan"), and simplify the maintenance surface.

Everything below is presented as **suggested changes** to review with the Northwind team — usage we cannot see (seasonal cycles, planned go-lives, reporting from other tools) may change a conclusion. Window analyzed: 180 days of audit + the Activity Report.

How to read this report:  implemented & in use ·  caution / partially used / verify ·  implemented but NOT used (or broken) ·  suggested change to validate.

Part 1 — What is implemented

In plain terms: the full inventory of the application as built.

1.1 Oracle EPBCS modules — installed & active map

The diagram above shows every Oracle planning module: green = installed and actively used, yellow = installed but only partially used, red = installed but dormant, grey = not installed. Data flows left to right: NetSuite/source loads BSO planning cubes ASO reporting cubes Smart View, dashboards and reports.

- ✓ **Active:** Financials.
- ⚠ **Partially used:** RevPlan (data flows, no module rules).
- ✗ **Dormant (built, paid for, not running):** Workforce — last activity 2026-02-24.
- Not installed:** Capital, Projects, Strategic Modeling — available in EPBCS if a future need appears.
- ✓ **Inside Financials, the features turned ON:** Chart-of-accounts support, Multi-currency, Expense planning — this is an expense-and-revenue P&L planning footprint.
- ⚠ **Features turned OFF (licensed but not enabled):** Cash Flow planning, Revenue & margins, Rolling forecast, Weekly planning — confirm each was intentionally skipped rather than never finished. See 1.2 for the cash-flow opportunity.

1.2 Financials features — what's on, and the Cash Flow gap

A frequent question: "are we doing anything with cash flow?" The answer for Northwind today is **no** — and it is worth understanding why, because the capability is already licensed.

- ✗ **No cash-flow planning exists today.** Cash Flow is **not a separate module** in EPBCS — it is a **feature inside the Financials module**, and it is turned off (`q_cashFlow = false`). There are **no cash-flow forms, rules, dashboards or accounts** anywhere in the application — only ordinary P&L accounts whose names contain the word "cash" (e.g. "Interest Expense : Cash"), which are not a cash-flow statement.
- ⚠ **It is not a switch.** EPBCS cash flow (indirect method) is driven from the **Balance Sheet**, which is **also off** here (the custom dimensions are flagged `NoBalanceSheet`, `NoCashFlow`). Enabling cash flow first needs a Balance Sheet structure and working-capital drivers — a small, scoped project, not a configuration toggle.
- 💡 **The opportunity:** Northwind already pays for cash-flow planning inside the Financials license. If liquidity/working-capital planning is a need, the foundation (actuals, P&L, NetSuite integration) is in place — only the Balance Sheet + Cash Flow build is missing. Listed as a START USING item in Section 4.2.

What the previous team built — model by model

In plain terms, as if explaining this application to someone who has never seen it: what each cube was designed to do and how they were meant to work together.

- **OEP_FS — the Financials engine.** A corporate P&L / expense planning model on Oracle's Financials module. NetSuite actuals load here, currency conversion and consolidation rules run, and Forecast/Plan scenarios live alongside Actuals. This is the spine the rest of the application reports from.
- **RevPlan — a custom Revenue model.** Built specifically for Northwind's business (psychometric testing): revenue planned bottom-up by **client, site, testing volumes, fees and average rate per test**, then mapped into the Financials P&L. The 58 forms and 61 rules show a serious, purpose-built revenue-planning process.
- **WFPlan — the Workforce model.** Oracle's Workforce module: headcount and compensation planned by **employee, job and department**, then pushed into Financials as a salary/benefits expense. The most detailed model on paper (Employee + Job dimensions) but the least populated in practice.
- **FinRpt / RevRpt / WFRpt — the reporting layer.** Aggregate-storage (ASO) mirror cubes built for fast Smart View / dashboard reporting, fed from the three planning cubes through data maps (Section 1.4). **FinRptH** was meant to be the financial *history* cube — but it was never loaded (Section 3.2).
- **How it was meant to flow:** NetSuite OEP_FS (actuals) ; Revenue planned in RevPlan and Workforce in WFPlan both pushed into OEP_FS everything pushed out to the ASO reporting cubes consumed in Smart View, dashboards and Financial Reports. A complete three-stream FP&A design.

Cube detail

Cube	Type	Module / purpose	Size	Status (from usage data)
RevPlan	BSO	Revenue planning (custom)	2,156 MB	⚠ No revenue-prefixed rule executions in the audit window — input appears to flow via Smart View + Financials rules
WFPlan	BSO	Workforce (EPBCS module)	11,339 MB	✖ Rules last ran 2026-02-24 — dormant since then
OEP_FS	BSO	Financials (EPBCS module)	10,665 MB	✔ Active — actuals consolidation runs daily (last 2026-06-12)
WFRpt	ASO	Workforce reporting (ASO)	37 MB	⚠ 2,935,454 cells — stale if Workforce is dormant
RevRpt	ASO	Revenue reporting (ASO)	46 MB	⚠ 2,338,824 cells but only 1 form — consumed via Smart View only
FinRpt	ASO	Financial reporting (ASO)	379 MB	✔ 22,847,745 input cells — receives pushed data
FinRptH	ASO	Financial reporting - history (ASO)	0 MB	✖ 0 input cells — built but EMPTY. Never loaded

- ⚠ **Hybrid BSO is disabled** (Activity Report). All upper-level aggregations are stored — WFPlan is 99% upper-level blocks for a module that is not running. Enabling Hybrid (or trimming stored aggregations) is a follow-up optimization conversation.

1.3 Artifact inventory

Artifact	Count	Notes
Forms	172	FinRpt: 27 · FinRptH: 1 · OEP_FS: 29 · RevPlan: 58 · RevRpt: 1 · WFPlan: 39 · WFRpt: 17
Business rules (LCM)	155	FinRpt: 2 · OEP_FS: 65 · RevPlan: 61 · WFPlan: 27
Dashboards	21	Financials / Revenue / Workforce folders
Navigation flows	2	Budget, Forecast
Smart Lists	0	—
Custom menus	22	—
Scheduled jobs (LCM)	24	incl. Clear Cube / Export Data / Export Metadata definitions
Valid combination rules	4	—
Financial Reports	162	from Activity Report
Data Integration artifacts	252	pipelines/mappings (FDMEE)

1.4 Data maps — how data flows between cubes

The diagram above shows every data map (Smart Push / Reporting Mapping) defined in the application — the internal plumbing that copies data from the planning cubes into the reporting cubes.

Data map	From	To	Note
OEPFS2FinRpt	OEP_FS	FinRpt	
OEPFS2FinRpt_Temp	OEP_FS	FinRpt	! "_Temp" — looks like a leftover test map
OEPFS2FinRptAct	OEP_FS	FinRpt	
OEPFS2FinRptEBITDA	OEP_FS	FinRpt	
RevPlan2FinRpt	RevPlan	FinRpt	
RevPlan2FinRptAct	RevPlan	FinRpt	
RevPlan2FinRptActSC	RevPlan	FinRpt	
RevPlan2FinRptActSC2	RevPlan	FinRpt	
RevPlan2FinRptAFcst	RevPlan	FinRpt	
RevPlan2FinRptFct	RevPlan	FinRpt	
RevPlan2OEPFSAct_Temp	RevPlan	OEP_FS	! "_Temp" — looks like a leftover test map
WFPln2FinRpt	WFPlan	FinRpt	
WFPln2FinRpt2	WFPlan	FinRpt	
WFPln2OEPFS	WFPlan	OEP_FS	
WFPln2WFRpt	WFPlan	WFRpt	

- ✔ **15 data maps** keep the reporting cubes fed: OEP_FS FinRpt, RevPlan FinRpt, WFPlan FinRpt, WFPlan OEP_FS, WFPlan WFRpt.

-  **No data map feeds RevRpt or FinRptH** — consistent with FinRptH being empty; RevRpt is loaded directly from Data Management instead, a second path worth confirming on purpose; each orphan needs a finish-or-remove decision.
-  **2 "_Temp" maps** (OEPFS2FinRpt_Temp, RevPlan2OEPFSAct_Temp) look like leftovers from builds/tests — confirm and remove.

1.5 Dimension profile — are the dimensions normal or odd?

Member counts, dense/sparse role and hierarchy depth per planning cube (from the Activity Report outline). This is what tells us whether a dimension is a healthy part of the model, an oversized one, or a candidate to leave with a retired module.

Cube	Dimension	Role	Declared	Stored	Levels	Reading
RevPlan	Department	Sparse	9,583	9,451	7	 Largest dimension — the main sparsity driver of this cube
RevPlan	Site	Sparse	3,215	3,214	5	 Normal
RevPlan	Entity	Sparse	270	178	8	 Has alternate/shared rollups (normal for reporting views)
RevPlan	Currency	Sparse	59	57	3	 57 currencies stored — confirm how many actually carry data
RevPlan	Account	Dense	60	39	7	 Has alternate/shared rollups (normal for reporting views)
RevPlan	Years	Sparse	19	18	3	 Normal
RevPlan	Plan Element	Sparse	27	18	4	 Has alternate/shared rollups (normal for reporting views)
RevPlan	Scenario	Sparse	35	17	4	 Has alternate/shared rollups (normal for reporting views)
RevPlan	Period	Dense	36	14	4	 Has alternate/shared rollups (normal for reporting views)
RevPlan	Version	Sparse	9	8	3	 Small plumbing dimension — normal in EPBCS
RevPlan	View	Sparse	7	6	4	 Small plumbing dimension — normal in EPBCS
RevPlan	Integration	Dense	10	3	4	 Has alternate/shared rollups (normal for reporting views)
WFPlan	Site	Sparse	3,217	3,216	5	 Normal
WFPlan	Employee	Sparse	2,884	2,884	5	 Workforce-only dimension — leaves the system if the module is retired

Cube	Dimension	Role	Declared	Stored	Levels	Reading
WFPlan	Department	Sparse	1,784	1,720	11	⚠ Very deep hierarchy (11 levels) — review whether all rollup layers are used
WFPlan	Job	Sparse	1,003	1,003	4	✖ Workforce-only dimension — leaves the system if the module is retired
WFPlan	Entity	Sparse	349	257	8	✅ Normal
WFPlan	Account	Dense	227	145	8	✅ Has alternate/shared rollups (normal for reporting views)
WFPlan	Currency	Sparse	59	57	3	⚠ 57 currencies stored — confirm how many actually carry data
WFPlan	Years	Sparse	19	18	3	✅ Normal
WFPlan	Scenario	Sparse	35	17	4	✅ Has alternate/shared rollups (normal for reporting views)
WFPlan	Period	Dense	23	14	4	✅ Has alternate/shared rollups (normal for reporting views)
WFPlan	Version	Sparse	9	8	3	✅ Small plumbing dimension — normal in EPBCS
WFPlan	Line Item Detail	Sparse	8	7	3	✅ Small plumbing dimension — normal in EPBCS
WFPlan	Integration	Dense	7	3	4	✅ Has alternate/shared rollups (normal for reporting views)
OEP_FS	Department	Sparse	11,341	11,152	11	⚠ Largest dimension — the main sparsity driver of this cube
OEP_FS	Site	Sparse	3,215	3,214	5	✅ Normal
OEP_FS	Account	Dense	863	409	8	✅ Has alternate/shared rollups (normal for reporting views)
OEP_FS	Entity	Sparse	349	257	8	✅ Normal
OEP_FS	Currency	Sparse	59	57	3	⚠ 57 currencies stored — confirm how many actually carry data
OEP_FS	Period	Dense	46	22	4	✅ Has alternate/shared rollups (normal for reporting views)
OEP_FS	Plan Element	Sparse	28	19	4	✅ Has alternate/shared rollups (normal for reporting views)
OEP_FS	Years	Sparse	19	18	3	✅ Normal
OEP_FS	Scenario	Sparse	35	17	4	✅ Has alternate/shared rollups (normal for reporting views)
OEP_FS	Version	Sparse	9	8	3	✅ Small plumbing dimension — normal in EPBCS
OEP_FS	View	Sparse	7	4	4	✅ Has alternate/shared rollups (normal for reporting views)

- ✅ **Attributes used correctly:** 6 attribute dimensions (Contract Type 5, Client Name 92, Workforce Mapping 5, Program Type 14, Acquisition Type 9, Business Unit 7) — slicing without inflating the cube. Using Client Name (92) as an attribute instead of a base dimension is exactly right.
- ⚠ **Same-named dimensions differ per cube by design** (EPBCS): Department is 9,451 in RevPlan, 1,720 in WFPlan, 11,152 in OEP_FS. Not an error — but each copy is maintained by the metadata sync, so removing a module also removes its maintenance burden.
- ⚠ **Currency: 57 stored members in every cube.** If Northwind actually plans in a handful of currencies, the rest are dead weight in every block-creation decision — the level-0 data export shows exactly how many carry data (Section 1.6).
- ⚠ **Department reaches 11 levels deep.** Deep hierarchies are valid but slow aggregations and confuse Smart View navigation — verify the bottom layers are really used for reporting.
- ✖ **If Workforce is retired** (Section 2.4), Employee (2,884), Job (1,003) leave with it — among the application's largest maintained hierarchies.

RevPlan — 1,347,001 blocks

Forward (FY25–26): 0.3% · peak FY21

WFPlan — 82,935 blocks

Forward (FY25–26): 11.0% · peak FY23

OEP_FS — 1,583,975 blocks

Forward (FY25–26): 2.0% · peak FY23

Each panel = real level-0 data per planning cube, by fiscal year. **Green** = forward planning years (FY25–26), **gold** = FY24, **grey** = history. The application holds years of history but almost no forward plan — Revenue (RevPlan) collapses after FY21, evidence the planning process largely stopped.

1.6 Where the data actually lives — by cube, year and scenario

Scenario mix per planning cube — what kind of data each holds

Financials is dominated by Actuals (a history store); Revenue and Workforce are mostly Plan/Forecast with little or no Actuals — consistent with planning that was set up but not sustained.

The diagram above reads the real level-0 data exported from each cube. It answers the key question: from which year is there Actuals / Forecast / Budget, and is the application still being used to plan forward — or only to store history?

Cube	Blocks with data	Year span	Forward (FY25–26)	Reading
RevPlan	1,347,001	FY19–FY25	0.3%	✖ Almost no forward data — used as a history store, not for planning
WFPlan	82,935	FY20–FY26	11.0%	⚠ Mostly historical; light forward planning
OEP_FS	1,583,975	FY19–FY26	2.0%	✖ Almost no forward data — used as a history store, not for planning

- ✖ **Financials (OEP_FS): only 2.0% of the data is FY25–FY26.** 67% of all blocks are **OEP_Actual** — the cube is overwhelmingly a record of past actuals (peak years FY23, FY24), not a forward plan.
- ✖ **Revenue (RevPlan) looks abandoned in the data:** it peaks at **FY21 (702,226 blocks)** and collapses to **3,704 in FY25, with no FY24 or FY26 data**. The revenue model was actively used around FY20–FY22 and then effectively stopped — strong evidence it is no longer part of the live process.
- ✖ **Workforce (WFPlan) never carried weight:** 82,935 blocks total and **no OEP_Actual scenario at all** — only plan/forecast. Combined with rules dormant since 2026-02-24, the data confirms the module was built but barely adopted.
- ⚠ **Currencies: ~49 carry data** (of 57 stored), and roughly half are **_Reporting** conversion copies (USD_Reporting, GBP_Reporting...). So the real input-currency count is small — the rest are currency-conversion outputs, normal but worth confirming the list is current.
- 💡 **The big picture:** the application was clearly built as a full FP&A suite (Financials + Revenue + Workforce) and used that way around **FY20–FY22**; today the live footprint is **Financials actuals only**. The level-0 data is the hard proof behind the usage story in Part 2.

Part 2 — What is actually used (last 180 days)

In plain terms: the application audit records every rule execution, data change and admin action. This part compares that against the inventory.

2.1 Users

User	Audit actions	Last activity	Who
user1@northwind.com	32,058	2026-02-25	Northwind
user2@northwind.com	22,935	2026-03-18	Northwind
advisor1@partner.com	3,844	2026-05-26	BPC / Oracle / system
advisor2@partner.com	1,093	2026-05-26	BPC / Oracle / system
advisor3@partner.com	1,047	2026-06-12	BPC / Oracle / system
user3@northwind.com	762	2026-06-09	Northwind
user4@northwind.com	667	2026-05-27	Northwind
System	73	2026-05-16	BPC / Oracle / system

- ✖ Only 4 real Northwind users appear in 180 days — and activity is shrinking: user1@northwind.com (32,058 actions) last appeared 2026-02-25, user2@northwind.com last appeared 2026-03-18.
- ⚠ The Activity Report confirms it: 5 unique users in 30 days (including consultants), ~2 in the last week. The application currently depends on one active business user.
- 💡 This is the central question for Northwind: is the application meant to be used this little? If yes — simplify and cut maintenance cost. If no — a re-onboarding push (training, navigation flows, forms that match how users actually work) recovers the investment already made.

2.2 Business rules — executed vs dormant

Business rules — dormant share

155 rules in the app
→ 17 executed
89% dormant

Dormant is not automatically useless — seasonal rules exist — but each one deserves a keep/retire decision.

Where data entry happens

54,892

data changes via
Smart View ad-hoc

0

data changes via
Planning forms

All audited data input in 180 days came through ad-hoc grids — the 172 built forms are bypassed.

Most-executed calculations (180 days) — colour = module

All real calc volume is the daily Financials actuals chain (green = OEP_FS). Workforce (red) ran a handful of times; everything else is idle.

Forms & rules built vs. used, per cube

Top bar = forms built; bottom bar = rules (solid = actually executed, grey = dormant). RevPlan has 58 forms and 61 rules — none of those rules ran in the window.

Of **155 rules** in the application, **17 distinct rules** executed in 180 days:

Rule	Cube	Runs	Last run
Plan - Consolidate Actual	OEP_FS	1,094	2026-06-12
Plan - ClearSiteCostAllocation	OEP_FS	1,094	2026-06-12
FIN_AllClear	OEP_FS	808	2026-06-12
TEMP_SEQ_ActualLoad		546	2026-06-12
Plan - Rollup Plan All Entities	OEP_FS	116	2026-05-15
Plan - Admin Rollup	OEP_FS	18	2026-02-17
zz_FINClear	OEP_FS	12	2026-02-19
WFP_Currency Forecast	WFPlan	8	2026-02-12
WFP_Forecast - Calculate All Employees Forecast	WFPlan	8	2026-02-12
WFP_Expense_Propagate_SmartList_Values	WFPlan	8	2026-02-12
Plan - Archive Scenario - Select All	OEP_FS	6	2026-05-28
FIN_Currency_Forecast_SelectScenario	OEP_FS	4	2026-06-01
zz_Wk All Clear	WFPlan	4	2026-02-24
WFP_SEQ_CalcAllEmployeesDept		4	2026-02-12

- ❌ **140 rules (90%) did not run once** in 180 days. By cube: FinRpt: 2/2 · OEP_FS: 55/65 · RevPlan: 61/61 · WFPlan: 22/27.
- ⚠️ Dormant ≠ useless — some are month-end or annual-planning rules waiting for their season. But **names like Push OEP FS to FinRpt , FinRpt: Copy - Source Scenario Version to Target , Plan - Archive Scenario , Plan - Copy Actual to Forecast ...** should each get a keep/retire decision.
- ✅ The rules that DO run are healthy: small, fast (max 29s), mostly parallel — no performance problem.

2.3 Data entry — where the numbers actually come from

- ❌ **All 54,892 data changes in 180 days came through Smart View ad-hoc grids** (audit source: "Adhoc Writeback Grid") — there is not a single form-based data change in the audit.
- ❌ That means the **172 Planning forms** (with their folders, menus, validations and the 21 dashboards built on them) are **bypassed for input**. Forms may still be opened for viewing, but the data tells us the working tool is Excel.
- By user: user1@northwind.com (31,661) · user2@northwind.com (22,896) · user3@northwind.com (335) — and the two heaviest contributors have stopped (see 2.1).
- 💡 Decide deliberately: **either lean into Smart View** (retire most forms, keep a curated set, invest in governed templates) **or re-introduce forms** where control/validation matters (workflow, approvals, valid intersections do not exist in ad-hoc).

2.4 Module activity timeline

Module	Rule executions (180d)	Last activity	Verdict
Financials (OEP_FS)	3,142	2026-06-12	✅ In active use — daily actuals consolidation
Revenue (RevPlan)	0	—	⚠️ Data flows, but no revenue-specific rule activity — verify the planned process is still followed
Workforce (WFPlan)	30	2026-02-24	❌ Dormant since 2026-02-24 — module-level keep/retire decision needed

2.5 Main forms — what users are pointed to, and the rules behind them

Save triggers: WFP CalcAllEmployeesDept, WFP_Copy_Domestic_Assumption, WFP Calculate All Employees

The 81 forms surfaced in navigation, grouped by module. Each module's input forms trigger that module's calc chain on save (Financials→FIN_SEQ, Revenue→REV_SEQ, Workforce→WFP_SEQ) — a coherent, purpose-built design. **Note:** navigation also points to 37 forms that don't exist (disabled Cash Flow / Balance Sheet features).

The two navigation flows (Budget & Forecast) define what users actually see. Of the 172 forms in the app, **81 are surfaced in navigation** — these are the working data-entry screens. For each, the rule that runs when you click Save is shown (that is the calc the form drives).

Financials (OEP_FS) — 19 forms in navigation:

Form	What it does	Runs on save
Account Variances	Reviews actual-vs-plan variances	OFS_RoLLup

Form	What it does	Runs on save
Monthly Expenses Budget	Direct expense input by department	OFS_Rollup
OFS_Total Expense - Forecast	Direct expense input by department	OFS_Rollup
Total Site Expense - Forecast	Plans site-level fees and expenses	OFS_Rollup
Northwind Total Revenue-1	Planning / data-entry form	CURRENCY
Enter Expenses Suppressed	Direct expense input by department	FIN_SEQ_Direct Expense Input
Enter Site Expenses	Plans site-level fees and expenses	FIN_SEQ_Direct Site Expense Calculation
Enter Site Expenses Suppressed	Plans site-level fees and expenses	FIN_SEQ_Direct Site Expense Calculation

...and 11 more

Revenue (RevPlan) — 31 forms in navigation:

Form	What it does	Runs on save
REV Exchange Rates	Maintains FX rates for currency conversion	CURRENCY
Testing Revenue Domestic Input Suppressed	Inputs/derives testing & other revenue	REV_Calculated Volume
Allocated Site Expenses	Plans site-level fees and expenses	REV_SEQ_Direct Revenue Input
Average Rate Per Test Budget	Sets the average price per test	REV_SEQ_Direct Revenue Input
COGS and Site Fees Domestic Input Suppressed	Plans cost of goods sold	REV_SEQ_Direct Revenue Input
COGS and Site Fees International Input Suppressed	Plans cost of goods sold	REV_SEQ_Direct Revenue Input International
Domestic Volumes	Enters planned testing volumes (the revenue driver)	REV_SEQ_Calculated Volume
FIN Mapping	Maps source data into the model	REV_FIN Mappings

...and 23 more

Workforce (WFPlan) — 17 forms in navigation:

Form	What it does	Runs on save
IS Mapping	Maps source data into the model	DEFAULT
Discretionary Bonus	Plans discretionary bonus	WFP_SEQ_CalcAllEmployeesDept
Employee Benefits	Plans employee benefits	WFP_Copy_Domestic_Assumptions
Employee Benefits by Entity	Plans employee benefits	WFP_Copy_Domestic_Assumptions
Employee Benefits by Entity All	Plans employee benefits	WFP_Copy_Domestic_Assumptions
Existing Employees	Plans headcount by employee	WFP_SEQ_CalcAllEmployeesDept
International Employee Benefits	Plans employee benefits	WFP_Copy_Domestic_Assumptions
Pay Periods	Plans salary / pay calendar	WFP_Copy_Domestic_Assumptions

...and 9 more

- 
The forms map cleanly to the three modules' rules: Financials forms trigger `FIN_SEQ_*` expense calcs, Revenue forms trigger `REV_SEQ_*` volume/revenue calcs, Workforce forms trigger `WFP_SEQ_*` employee calcs — a coherent, purpose-built design.

-  **Navigation points to 37 forms that do not exist** in the application — e.g. "Revenue Overview", "Trend Based Other Domestic Revenue", "OFS_Income Statement - Simplified", "OFS_Driver Based Balance Sheet", "OFS_Calculated Balance Sheet". These are **Cash Flow / Balance Sheet / Rolling Forecast** screens from the default template whose features are turned off (Section 1.2). Users clicking those menu items hit dead ends — clean the navigation flow to match what's actually enabled.

Part 3 — Configuration health & half-built pieces

Planning window — how time is defined in the model

PLANNING HORIZON FY24 → FY32

Actuals → May FY26

Forecast FY26–FY27

FY24FY25FY26FY27FY28FY29FY30FY31

⚠ Two period clocks disagree: OEP_CurMnth = Jan/FY25 (stale) vs PAI actual load = May/FY26 (current). Align them.

Green = years with loaded actuals (through May FY26); gold = the active forecast window (FY26–FY27); grey = the full plan horizon kept open to FY32. The forecast window is driven by substitution variables — keep them current each month.

3.1 Substitution variables — are they current?

Of 75 substitution variables, 15 look stale or need verification (the other 60 are current or intentionally point backwards):

Variable	Scope	Value	Status
OEP_CurMnth	ALL	Jan	❌ Stale — should reflect the current month (June 2026; verify against your fiscal calendar)
OEP_CurMnth	OEP_FS	Jan	❌ Stale — should reflect the current month (June 2026; verify against your fiscal calendar)
OEP_CurQtr	ALL	"Qtrly 1"	⚠ Still at quarter 1 — verify
OEP_CurQtr	OEP_FS	"Qtrly 1"	⚠ Still at quarter 1 — verify
OEP_CurYr	ALL	FY25	❌ Stale — points at FY25 (verify against your fiscal calendar)
OEP_FCSTStartYr	ALL	FY24	⚠ Points at an old year — verify
OEP_PlanStartYr	ALL	FY24	⚠ Points at an old year — verify
OEP_QrtlyFcstStart	ALL	FY24	⚠ Points at an old year — verify

OEP_YearRange	ALL	FY24	⚠ Points at an old year — verify
OEP_YrlyFcstStart	ALL	FY24	⚠ Points at an old year — verify
OEP_YrlyPlanStart	ALL	FY24	⚠ Points at an old year — verify
PAI_CurrentMonth	ALL	Dec	❌ Stale — should reflect the current month (June 2026; verify against your fiscal calendar)
PAI_RemainingFcstYears	ALL	FY24:FY27	⚠ Points at an old year — verify
PlanStartYr	ALL	FY24	⚠ Points at an old year — verify

- ❌ A stale **current-month variable** silently breaks every form, rule and report that uses it — symptoms look like "the form shows the wrong period". Updating these is a 10-minute fix that should be part of a monthly close checklist.

3.2 Built but empty / half-finished

- ❌ **FinRptH (ASO) has 0 input cells** — a history-reporting cube that was created (with 1 form and its own dimensions) but never loaded. Either finish it (load history, point reports at it) or remove it.
- ⚠ **All 4 ASO cubes have 0 aggregate views** — queries always hit input-level data. Fine at today's sizes (WFRpt 37MB, RevRpt 46MB, FinRpt 379MB, FinRptH 0MB), but build default aggregations if reporting grows.

-  **RevRpt and WFRpt each expose 1/17 forms** while holding millions of cells — they are Smart View-only surfaces today.
-  **Outline warnings** (Activity Report): Dynamic-calc L0 members without a formula — RevPlan: [Period].[YTD.], [Site].[Operations Sites], [Scenario].[OEP_Var % - Actual vs Forecast], [Scenario].[OEP_Y-O-Y % Change]; WFPla... — dynamic-calc level-0 members without formulas return no data and confuse users; the shared-member generation-2 warnings affect aggregation correctness. A cleanup pass is low-effort.

3.3 Capacity & runtime (context, not a problem)

-  The application is small and fast: 26 GB Essbase data, slowest calc 29s, 1.4% of UI requests over 2s, availability 99.57%.
-  **WFPlan stores 18,983,366 blocks (11,339 MB, 99% upper-level)** for a dormant module — if Workforce stays retired, clearing/archiving it shrinks backups and maintenance windows.
-  Smart View 25.200 on Excel 16.0 — current versions.

Part 4 — Suggested changes & next steps

4.1 Suggested changes (prioritized)

💡 marks each **suggested change** — decisions to make together with Northwind, validated in test before production.

1. 💡 **Hold a module-by-module keep/retire review** using Section 2.4: Financials = keep (active); Workforce = decide (dormant since 2026-02-24); Revenue = confirm the intended process vs. the Smart View reality.
2. 💡 **Fix the stale substitution variables** (Section 3.1) and add them to a monthly close checklist — cheapest fix with the most user-visible impact.
3. 💡 **Decide the data-entry strategy** (Section 2.3): curated Smart View templates as the official channel, or a small set of governed forms — and retire the rest of the 172 forms either way.
4. 💡 **Resolve FinRptH** — finish loading it (history reporting) or remove the empty cube.
5. 💡 **Retire or archive the dormant rules** after the seasonal check (Section 2.2) — fewer artifacts = faster migrations, clearer Calculation Manager, less audit noise.
6. 💡 **Clean the outline warnings** (Section 3.2) and re-run the Activity Report to confirm.
7. 💡 **If usage should grow:** a short re-onboarding plan (navigation-flow refresh + training for the 2 returning users + dashboards that answer their actual questions) — the application is already built and paid for.

4.2 The decision board — keep, start using, or remove

KEEP — earning its keep

- Financials (OEP_FS) + FinRptdaily actuals chain runs like clockwork
- NetSuite integration 2 pipelines, 24 loads, current to May FY26
- Smart View input where 100% of data entry already happens

START USING — built, needs only data

- FinRptH history cube one load away from multi-year reporting
- RevPlan planning (58 forms, 61 rules) revenue planning is built; adopt the process
- Cash Flow planning licensed in Financials, never enabled · needs Balance Sheet first
- 21 dashboards + flows work again once the variables are fixed

REMOVE / ARCHIVE — not used

- Workforce (WFPlan + WFRpt) dormant since Feb · 11,339 MB to free
- 140 dormant rules, zz_TEMP_first after one seasonal cycle check
- _Temp data maps + 13 training mappingstest debris in the integration layer

The board above summarizes the whole assessment in one view. Three buckets: what is earning its keep, what is already built and only needs data or a small push to deliver value, and what is candidate to leave the system. Every item links back to the evidence section.

✓ KEEP — in use, earning its keep

- **OEP_FS (Financials)** + its daily actuals chain (Consolidate Actual, ClearSiteCostAllocation, FIN_AllClear) — the heartbeat of the application (2.2/2.4).
- **FinRpt (ASO)** — 22.8M cells, fed by 11 data maps from all three planning cubes (1.3).
- **The NetSuite integration** — 2 pipelines, 24 loads; actively maintained and current through May FY26 (1.2).
- **Smart View as the de-facto input channel** — it is where 100% of data entry happens today; keep it, but make it official with governed templates (2.3).

! START USING — already built & paid for; needs only data or a small push

- **FinRptH** — the history-reporting cube exists with its form; it just was never loaded. One data load away from giving Northwind clean multi-year reporting without bloating the planning cubes (3.2).
- **RevPlan's planning side** — 58 forms + 61 rules for revenue planning (volumes, fees, rate per test) sit ready; today only actuals flow in. If revenue planning is wanted, the build is done — it needs process adoption, not consulting hours (2.2/2.4).

- **Dashboards & navigation flows** — 21 dashboards and 2 flows already match the Budget/Forecast processes; with the variables fixed (3.1) they work again and make re-onboarding the returning users easy.
- **Valid intersections & approvals** — governance features that come free with the forms if Northwind ever moves input back from ad-hoc grids (2.3).
- **Cash Flow planning** — licensed inside the Financials module but never enabled (Section 1.2). A natural next step for liquidity/working-capital planning; note it requires a Balance Sheet structure first, so scope it as a small project, not a configuration toggle.

✖ REMOVE / ARCHIVE — unused, stale, or leftovers

- **Workforce (WFPlan + WFRpt)** — dormant since 2026-02-24; if the decision is to retire it, archive a snapshot and clear ~11,339 MB of stored aggregations (2.4/3.3).
- **140 dormant rules** — after a one-cycle seasonal check, retire the clear leftovers first: the `zz_*` and `TEMP_*` rules are explicitly named as scrap (2.2).
- **"_Temp" data maps** (OEPFS2FinRpt_Temp, RevPlan2OEPFSAct_Temp) and the **13 "training" source-period mappings** in Data Management — test debris (1.2/1.3).
- **Stale substitution variables** — not "removed" but fixed: align the OEP_* clock with the PAI_* clock and add it to the monthly close checklist (3.1).
- **Unused forms after the data-entry decision** — once the channel is official, the bulk of the 172 forms can be archived; keep the curated shortlist (2.3).

4.3 What we could analyze next

- 💡 **Form-level usage over time** — with audit enabled going forward, a quarterly re-run shows whether the strategy decisions stick.
 - 💡 **Cube optimization analysis** (the BPC performance deliverable) — if Workforce is kept, its 99%-upper-level storage with Hybrid disabled is the first candidate.
 - 💡 **Financial Reports inventory** — 162 FR artifacts vs. which ones are actually executed (needs FR access logs).
 - 💡 **Data Integration review** — 252 DM artifacts vs. the loads that actually run.
-

Counts are exact from the LCM export (172 forms, 155 rules) and the 180-day application audit (62,479 records). Usage conclusions are inferences from telemetry — always confirm intent with the Northwind team before retiring artifacts.
